Aim of the Project

Many companies record and monitor their product purchases, sales and storage processes on their computer by using desktop applications. These applications enable companies to define their own products, determine their characteristics, keep records of products that have been purchased and sold, as well as in which warehouse the products are stored and instantly follow-up the transfer processes of the products.

With the development of technology, companies want to access such information instantly from anywhere. Because of that, in this project, we have aimed to respond to these requests of the companies.

We are planning to design a web platform to provide accessibility from anywhere. We are planning to use these technologies:

- MySQL
- PHP
- ReactJS || AngularJS
- HTML5

Server : WampServer

Versioning : Github
